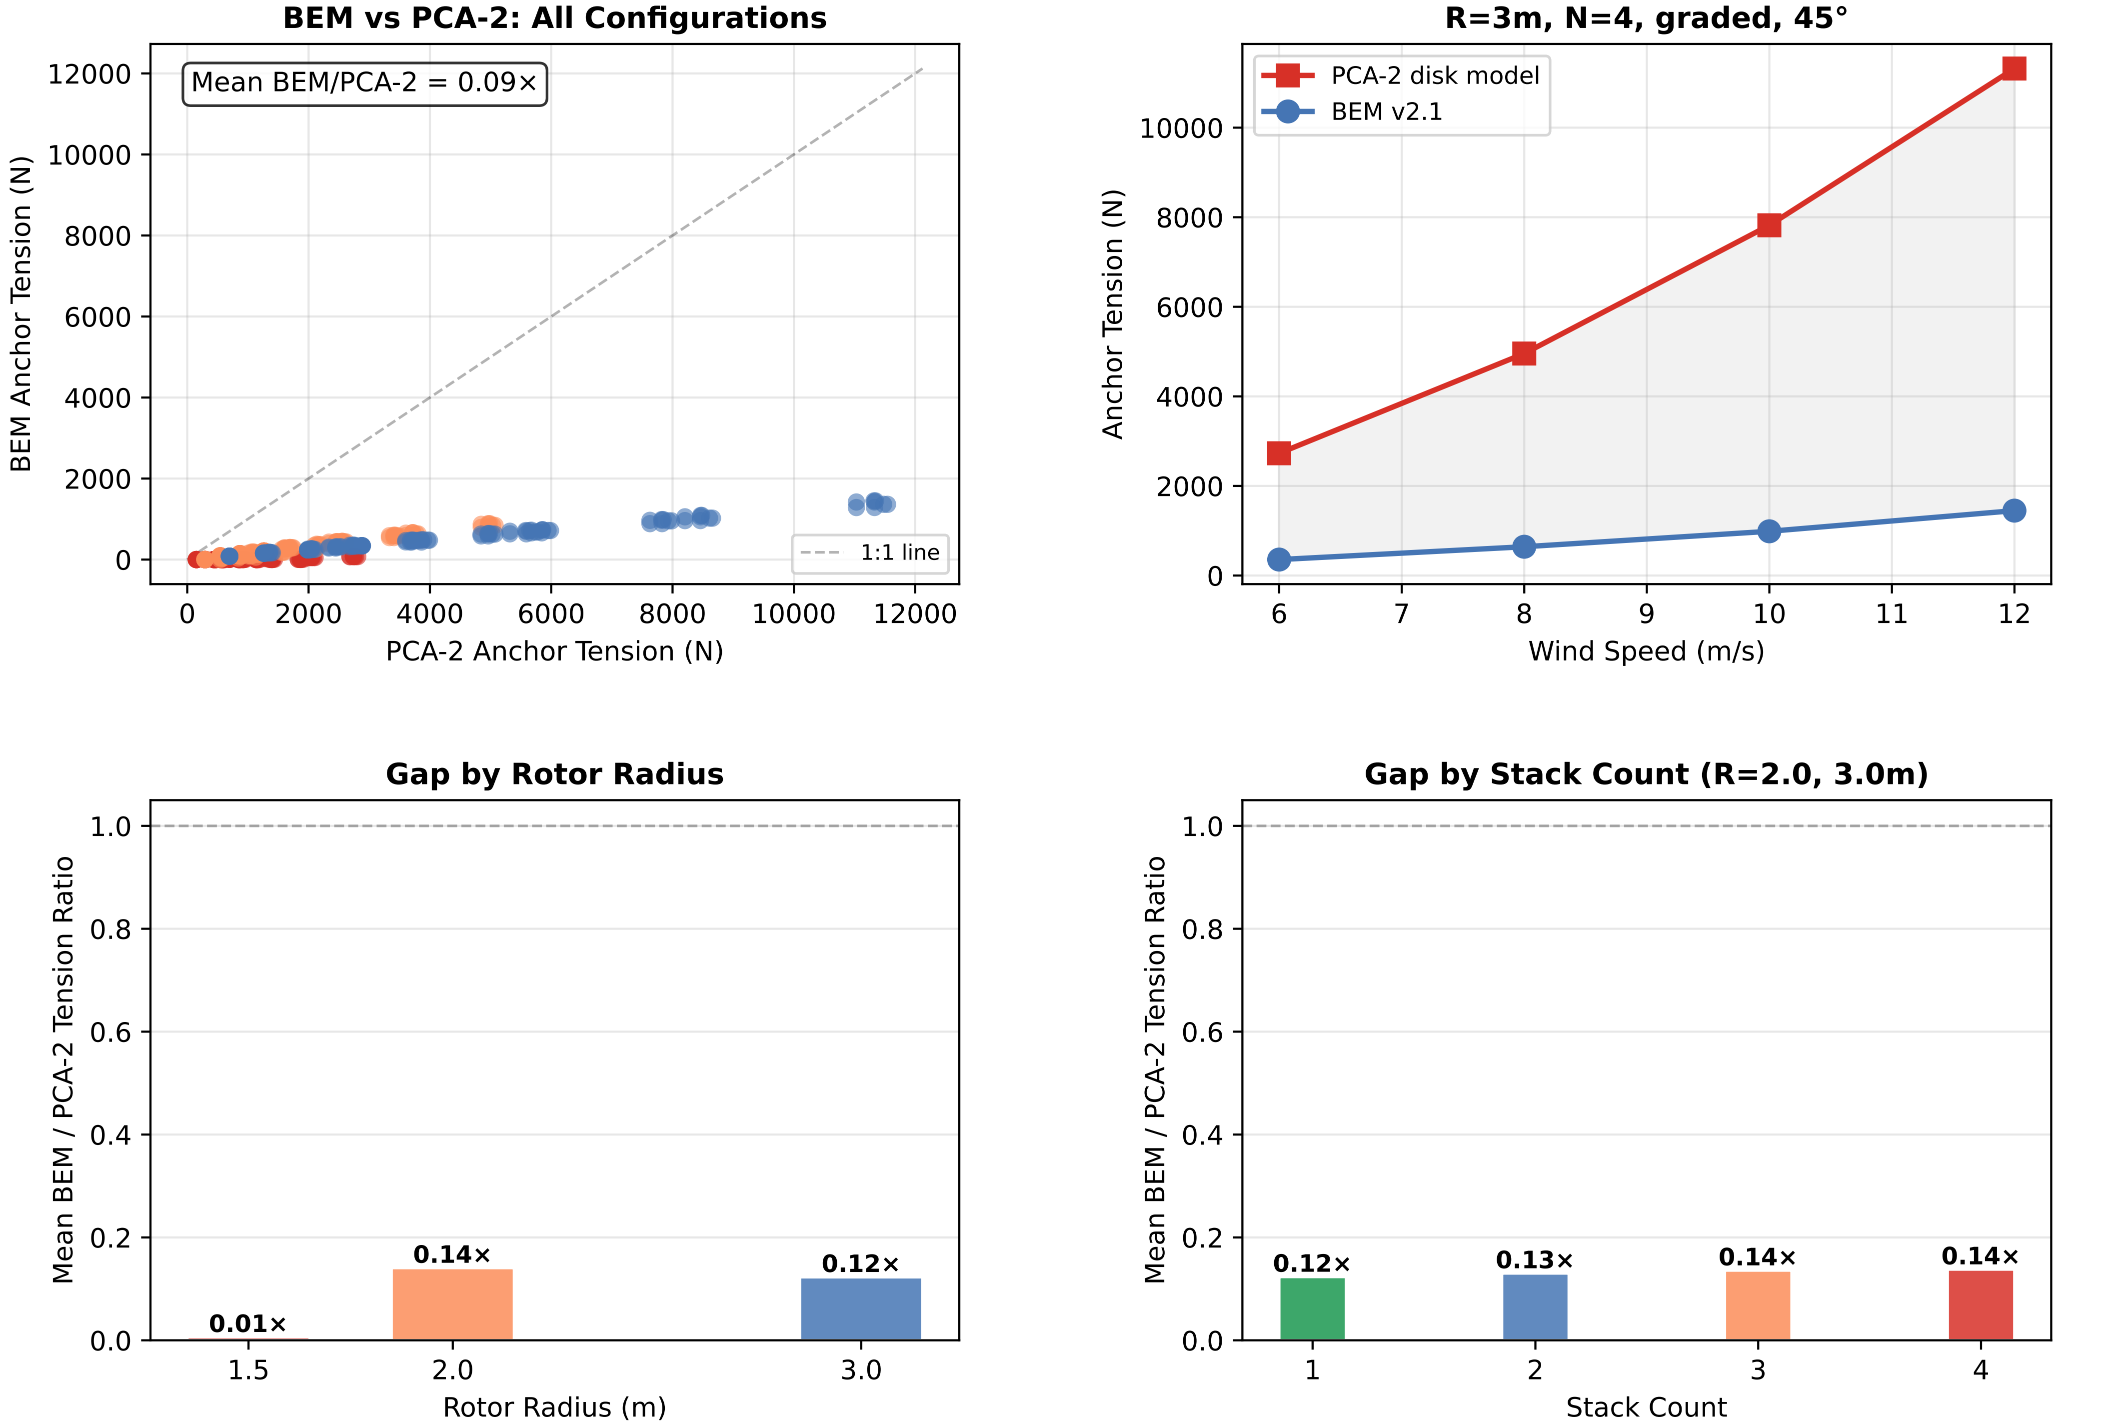
PCA-2 Disk Model vs BEM v2.1: What Did We Gain?
Identical Configurations, Different Aerodynamic Models



IMPLICATIONS: The PCA-2 disk model systematically overestimates forces by ~11× compared to BEM v2.1. The gap is largest at R=1.5m (~163×) and narrows at R=3.0m. This is the solidity + 2-D/3-D averaging gap (see DECISIONS.md D1). The PCA-2 empirical data represents a high-solidity disk (σ≈0.098) while BEM models our low-solidity blades (σ≈0.032). BEM is the design truth for our configuration. Data: identical sweep grid, 45° and 55° elevation.
