

Cost per Newton: Economics of Scale

BEM v2.1 — Estimated Manufacturing Cost Model

IMPLICATIONS: Larger rotors (R=3.0m) have lower cost per newton despite higher unit cost because tension scales with R^2 while cost scales with R (material). N=1 has the best \$/N ratio but delivers too little absolute tension. N=3-4 provides the best balance of cost efficiency and absolute performance. The cost model is simplified — real costs depend on manufacturing volume, material choices, and labour. Data: BEM v2.1, graded profile.
