

Cost vs Tension Trade-off: Where's the Budget Sweet Spot? BEM v2.1 — All Configurations Across Wind Speeds

IMPLICATIONS: The Pareto front is dominated by R=3.0m configurations. Cost scales roughly linearly with stack count; tension also scales linearly. The sweet spot is R=3.0m, N=3 with graded profile (3, 200, 530Nmean). Beyond N = 3, each additional rotor adds 700 for ~150 N — positive ROI but diminishing. N=1 configurations are cheap but deliver too little absolute tension for practical use. Data: BEM v2.1, all wind speeds 6-12 m/s.
