

Pareto: Tension vs Mass Efficiency by Rotor Radius BEM v2.1 — All (N,profile,elevation) Combinations

IMPLICATIONS: Radius dominates the Pareto frontier. R=1.5m produces near-zero tension — below the NACA 0012 viability threshold. R=2.0m reaches 200-500 N with good mass efficiency (20-40 N/kg). R=3.0m pushes the frontier to 400-900 N but at lower N/kg (15-35 N/kg) — more mass for proportionally less efficiency. The optimal radius depends on the tension target: R=2.0m for <400 N, R=3.0m for >500 N. Data: BEM v2.1, 384 configs.
