

No Pareto Trade-off: Anchor Tension and Mass Efficiency Are Co-linear BEM v2.0 — Corrected Polygon Solver (2026-07-27)

IMPLICATIONS: Tension and mass efficiency are co-linear — no Pareto trade-off exists. A single configuration ($R=3.0\text{m}$, $N=4$, graded, 859 N, 42.9 N/kg) dominates all others on both objectives. Tilt profile effect is 10.4% at $R=3.0\text{m}$: uniform tilt is a pragmatic choice. For design: maximise rotor radius within mechanical limits, stack as many rotors as line tension allows, do not over-invest in tilt profile differentiation. Data: BEM v2.1, corrected polygon solver. See SPEC.md §6.6.
