

RPM Operating Envelope by Rotor Radius BEM v2.1 — All Stack Counts & Profiles

IMPLICATIONS: R=1.5m rotors are stalled — RPM sits at the 10 RPM floor. R=2.0m+ rotors self-regulate via BEM torque equilibrium. R=3.0m reaches 78–93 RPM at 8–12 m/s. RPM scales linearly with wind speed for $R \geq 2.0\text{m}$. Stack count and tilt profile have negligible effect on RPM — the autorotation speed is set by the torque balance at a given wind speed and radius. Data: BEM v2.1, corrected polygon solver. See SPEC.md §6.6.
