

Stack Efficiency: Does Adding Rotors Scale Linearly? BEM v2.1 — Graded Tilt, 45° Elevation

IMPLICATIONS: Anchor tension scales linearly with stack count at $R=2.0m$. At $R=3.0m$, $N=1$ struggles to autorotate at low wind but $N \geq 2$ scales well. Each additional rotor adds 150–320 N of tension depending on wind speed. The stack does not saturate at $N=4$ — more rotors would add more lift. Practical limits: line weight, cost, and tower height. Data: BEM v2.1, graded profile, 45° elevation. See SPEC.md §6.6.
