

Power per Rotor vs Wind Speed
(BEM v2.1, 45° Elevation)

TRPT Power: Per-Rotor Contribution
— How Much Power Does Each Rotor Add?

Total Stack TRPT at 8 m/s
(per-rotor avg shown as _)

IMPLICATIONS: TRPT scales with both wind speed and rotor radius. At R=3.0m, 8 m/s, N=4 delivers 2.8 kW total (0.7 kW per rotor). Each rotor contributes roughly equally because the tension profile is nearly linear. The first rotor (topmost) sees the freshest wind but carries no line weight; later rotors see slightly deflected flow but experience higher local tension. The net per-rotor contribution is remarkably uniform. Data: BEM v2.1, graded profile.
