

Manufacturing Map: (Radius, N) Grid in PC Space

IMPLICATIONS: The (R,N) grid forms three parallel tracks in PC space — one per radius. Within each track, increasing N moves configurations vertically (PC2) without affecting PC1. Grid lines are nearly straight and parallel, confirming that rotor count and radius are independent design levers. Pareto-optimal points (annotated) show the best N/kg at each radius. Manufacturing strategy: tool for 3 rotor sizes (R=1.5, 2.0, 3.0m), offer 1-4 stacking options per size. The 96-configuration space reduces to a 3x4 product matrix. Data: 96 configurations from BEM v2.0 sweep.
