

PCA-2 Pareto: Tension vs Gust Stability

Lower CV = More Stable Across Wind Conditions

IMPLICATIONS: The PCA-2 model shows CV values of 30-60% across configurations. Higher-stack-count configurations (N=3,4) have lower CV — more rotors smooth out wind-speed sensitivity. R=3.0m has the lowest CV because larger rotors operate at higher Re where the PCA-2 CL/CD curves are flatter. Data: PCA-2 disk model, grouped by (R,N,profile,elevation) across 6-12 m/s.
