

PCA-2: Anchor Tension vs Wind Speed

PCA-2 Disk Model — Graded Profile, 45° Elevation

IMPLICATIONS: PCA-2 tension follows the expected v^2 scaling (parabolic shape). $R=3.0\text{m}$, $N=4$ reaches $>4000\text{ N}$ at 12 m/s in the PCA-2 model — compare with BEM which predicts $\sim 800\text{ N}$. The PCA-2 model assumes a high-solidity disk ($\sigma \approx 0.098$) while BEM resolves our low-solidity blades ($\sigma \approx 0.032$). Data: PCA-2 disk model, graded profile.
