

Radius Sensitivity: Tension vs Rotor Radius BEM v2.1 — Graded Tilt, 8 m/s, 45° Elevation

IMPLICATIONS: Anchor tension scales faster than disk area (R^2). $R=3.0\text{m}$ delivers $4.5\times$ the tension of $R=2.0\text{m}$ at the same $N=4$. $R=1.5\text{m}$ produces zero tension — below autorotation threshold. The scaling is super-linear: BEM induction captures the nonlinear benefit of higher Reynolds numbers on larger rotors. Data: BEM v2.1, graded profile, 8 m/s, 45° elevation. See SPEC.md §6.6.
