

Tilt Profile Comparison — R=3.0m, N=4

IMPLICATIONS: Radar chart comparing 4 tilt profiles at the best (R=3.0m, N=4) configuration. Values normalized 0-1 across profiles. Graded tilt edges ahead on tension and N/kg, but the absolute spread is 10.4% between best and worst (769-858 N mean across elevations). All profiles overlap heavily on Stability. Tilt profile has a moderate effect — not negligible. Build uniform tilt for manufacturing simplicity — graded tilt adds complexity for a 10% gain. Data: BEM v2.1, corrected polygon solver. See SPEC.md §6.6.
