

Tension Accumulation — R=3.0m, N=4, graded, 45°

IMPLICATIONS: Tension accumulates toward the anchor. Each rotor adds 150–170 N of along-line force at 8 m/s (550–610 N at 16 m/s). Between rotors, bare-line drag adds smaller tension. Tension above the topmost rotor drops to zero. With wind gradient ($\alpha=0.14$), anchor tension rises 31% (642→840 N at 8 m/s). Anchor line must be rated for ~2.3 kN at 16 m/s uniform wind, ~3.0 kN with gradient. Data: BEM v2.1, corrected polygon solver. See SPEC.md §6.6.
