

Tilt Profile Comparison — R=3.0m, N=4

IMPLICATIONS: Radar chart comparing 4 tilt profiles at the best (R=3.0m, N=4) configuration. Values normalized 0–1 across profiles. Graded tilt edges ahead on tension and N/kg, but the absolute spread is small — only 3.5% between best and worst (809–838 N). All profiles overlap heavily. Stability (1/CV) shows negligible spread (CV=0.467–0.472). Tilt profile is a fine-tuning parameter, not a primary design driver. Build uniform tilt for manufacturing simplicity; the performance penalty is under 4%. Data: BEM v2.0, corrected polygon solver. See SPEC.md §6.6.
