

Power Generation Potential — Stacked Autogyro Lift

R=3.0m, N=4, graded, 45° elevation

IMPLICATIONS: The stacked autogyro strongly favors fly-gen TRPT power over yo-yo cycling. At 12 m/s, TRPT delivers 64 kW (v5 Octagon) or 42 kW (Canonical). Yo-yo net delivers only 4.5 kW. The gap is 10-14x across all wind speeds. The autogyro produces steady lift. TRPT converts it directly to shaft power. Yo-yo wastes energy on the reel-in phase. For AWES deployment, pair the autogyro stack with a fly-gen kite turbine. Do not use it in yo-yo mode. Data: BEM v2.1, corrected polygon solver. See SPEC.md §6.6.
