

L/D Ratio Proxy: Which Profile Maximises Lift? BEM v2.1 — N=4, 45° Elevation

IMPLICATIONS: The tilt profile has a small effect on lift coefficient at R=3.0m (<4% spread). At R=2.0m the spread is wider because low Re effects interact with tilt. The optimum profile depends on wind speed — no single profile dominates. Graded tilt gives the best overall compromise. Data: BEM v2.1, N=4, 45° elevation. See SPEC.md.
