

Pareto: Tension vs Mass Efficiency by Stack Count BEM v2.1 — All (R,profile,elevation) Combinations

IMPLICATIONS: Stack count shifts the Pareto frontier outward — more rotors mean more absolute tension. N=1 reaches 200-400 N at high N/kg (30-50 N/kg). N=4 reaches 400-900 N at lower N/kg (15-30 N/kg). Mass efficiency decreases with stack count because each additional rotor adds mass (+5 kg) but proportionally less tension (diminishing returns from line angle coupling). The sweet spot depends on the target: N=2 for light/mass-efficient designs, N=4 for maximum absolute tension. Data: BEM v2.1, 384 configs.
